

Group Proposal Guidelines

For the proposal assignment, you will prepare a short write-up for a proposed innovation related to the topics discussed in class for that theme. The proposal has a 800-word limit (excluding references, figures, and any other creative presentations you may wish to make).

Your proposal should include the following information:

- Identify a key challenge or gap related to the first theme on ageing.
- Identify a key technology/innovation of your choice.
- Propose how your project can address the problem or challenge that you have identified.

Submission:

- Proposal is due before class in week 7.
- They should be submitted to NTULearn via your **cluster** site.
- Only **WORD** document format is allowed (PDF is not allowed).
- Please label your filename in the following format: TG01-A01 where TG = tutorial group number and A01 = cluster and table number.
- State your group members' names clearly on the front page of your assignment (as per matriculation card).
- **Three** submissions should be made: one for Turnitin submission, one for group submission, and one for submission of the Declaration of Academic Integrity.

The screenshot displays the NTULearn submission interface for 'Proposal 1 - Ageing'. It lists three submission types, all with a due date of 2/19/24, 2:29 PM and a status of 'Hidden from students':

- Proposal 1 - Turnitin submission:** Includes a note: '*Only WORD format is allowed* Note that only ONE submission per group should be made. State your tutorial group number, cluster, table number, and all your group members' names clearly on the front page of your assignment. Please label your filename in the following format: P01_TGxx_Z-yy where P = proposal, TG = tutorial group number, Z-yy = cluster alphabet followed by table number. An example would be P01_TG01_A-01.'
- Proposal 1 - Group submission:** Includes a note: '*Only WORD format is allowed* Note that only ONE submission per group should be made. State your tutorial group number, cluster, table number, and all your group members' names clearly on the front page of your assignment. Please label your filename in the following format: P01_TGxx_Z-yy where P = proposal, TG = tutorial group number, Z-yy = cluster alphabet followed by table number. An example would be P01_TG01_A-01.'
- Proposal 1 - GAI Declaration per team:** Includes a note: 'Please submit your GAI declaration here.'

- Only one student needs to submit on behalf of the team. The group submission is viewable by the rest of the group members. The Turnitin submission can only be viewed by the submitter.

Additional notes:

- 1) When you cite someone's work, you must give due credit and acknowledgment to the original idea or person.
- 2) **If you use any generative AI (GAI) tools (including Grammarly), you must include a digital paper trail (i.e., your original work with no AI content).** You can include this as an appendix, or provide a link generated by GAI (see for example this [2 min video](#)). See [here](#) for how to cite GAI
- 3) Refer to the grading rubric found in Appendix 2 of your syllabus for grading criteria.

- 4) The clearer you are about the scientific/business/social scientific rationales behind your approach, the better. Remember to provide adequate support for your decisions by using data and analyses from research studies and reports where necessary.
- 5) Make close connections with course content where possible.

Frequently Asked Questions

Q: Does our proposed idea need to be situated/applied in Singapore?

A: No, it can be something for the general public outside of Singapore. But more often than not it is easier to design and justify a target solution for a specific target audience. So, you may want to scope your target audience further.

Q: Does our proposed idea need to be based on topics covered directly in class?

A: Not necessarily, but there should be close connections with the lecture content. For example, physical aspects of ageing (osteoporosis, hearing loss, mobility) would be acceptable; diabetes in the general population would not be acceptable.

Q: Do we have to link our idea to class lectures?

A: Yes, this is a must have! The lectures have included many charts, statistics, concepts, and terms that will help you to define your problem and explain the relevance of your solution. The more precise you can be, the better. However, it is not necessary to cite particular lectures (see below about citations).

Q: Does our proposed idea need to be something tangible?

A: Not necessarily, but it should be something innovative that can solve the identified problem.

Q: Do we need to include citations?

A: If you have consulted sources (including websites) in drafting your proposal, you should include citations in a reference list which is excluded from the word limit. You may want to use citations and references to support claims and statistics that you include in your proposal. It is to make your proposal more convincing by citing credible references.

Q: Does our proposed technological innovation need to be something commercially available?

A: No, it does not. However, it needs to be doable and practical in terms of existing/developing technological readiness and likely cost.

Q: Does our proposed technological innovation need to be something we came up with by ourselves or are we allowed to adapt existing solutions that we identified?

A: Innovation requires new ideas. They do not need to be totally new ideas, but at least cannot be the same as existing products or solutions. You may want to think about how you can add value to existing products, have them perform additional tasks, or otherwise make improvements that can better address your identified problem.

Examples

Some examples based on the ageing theme (these are meant for your reference only and we hope this will not limit your ideas):

- **Innovation:** Development of app to help cope with dementia. *(The key challenge is that individuals/families/caregivers may not be able to plan adequate health and care strategies well when a family member is diagnosed with dementia. This tool would give more personalized indicators of needs, as well as activities to slow down decline and calm patients as an anticipatory approach).*
- **Application:** Tech-fair for seniors in senior centres, focusing on diet, health, and cognitive reserve-building. *(The key challenge is that seniors may only access abstract information about maintaining their health, but not have clear strategies about how to adjust their lifestyles to be healthier. This fair would feature already-existing senior-friendly gadgets for measuring nutritional values of food, improving physical mobility, and exercising cognitive functions with the identified target audience, clear messages, and most effective communication line as important considerations).*
