

Afternoon Prof, today we will be showcasing the prototype for our website Househunt which serves to provide a clear and accessible overview of housing options and related information in Singapore.

So this is the homepage which is dynamic where users can enable their current location so nearby block listings will show up. The users will be able to register and login where the registration will send a confirmation email to unlock the account and be able to use all the features. At the top of the homepage will showcase the overall statistics like the amount of housing seeded into the database and shown on the websites as well as the number of users for the platform. The top liked and top viewed is done using redis as a caching service, so it showcases the relevant houses as well as its statistics such as the change in likes or view count. The nearby your house image carousel is a component that is reused in the individual project card as well and show top level detail of the house such as transacted prices. The search listing functionality comes with default houses shown on the screen as well as filter selection where users can choose the street by selecting from a drop down or by typing. While the prices and date selection can be done using a slider. The available houses can also be sorted by descending or ascending by various categories such as price and likes.

Moving on to the individual housing pages. The left shows some details about the house such as town as well as top level details about the nearest amenities. The icon for the amenities can be hovered over for the category. The users are also able to leave a comment at the bottom of the project card, filling in another use case. The right showcases the price history for better understanding of the price trend for different room types as well as for different levels of the building with the ability to hide all the graphs and select specific types to the user liking. Lastly, the map at the bottom showcases the nearby amenities to the user from a map view, where the pulsing purple larger dot is the actual house and the other colored dots can be hovered to know the top-level detail of the respective amenity.

The website also has a page on guides for purchasing a flat to enable a smooth process for prospective homeowners as well as direct links to the respective government websites. The about us page aims to give the users a overview on the aim of the project and give credit where it's due.
